

Assignment 5: Artificial Neural Network Modeling for Sewage Treatment Plant

Problem Description

The dataset provided corresponds to operational data from a Sewage Treatment Plant (STP). The dataset contains the following normalised (between 0 and 1) wastewater quality parameters:

1. BOD*Q (BOD = Biochemical Oxygen Demand)
2. COD*Q (COD = Chemical Oxygen Demand)
3. TSS*Q (TSS = Total Suspended Solids)
4. DO*Q (DO = Dissolved Oxygen)

Where Q is the sewage flow rate

In this dataset:

- Parameters 1, 2, and 3 are the input variables (features).
- Parameter 4 is the output variable (target).

Your task is to develop Artificial Neural Network (ANN) Model(s) to predict the output from the mentioned input variables.

Refer to the attached publication for getting started. The expectation is to use this work as a starting point for building models beyond what has already been published.
